The visualization created shows the U.S. News Rankings versus the endowment size of the top universities in the United States. The colors and labels help differentiate between the different universities in the chart. The pattern that can be seen based on this visualization is that those universities with a smaller endowment, when compared to the other universities, have a lower U.S. news ranking. Conversely, those universities with a larger relative endowment have a higher U.S. news ranking. Based on this we can see a correlation between the U.S. news rankings and the endowment size. Higher U.S. news rankings correlate with large endowments. This could be useful for prospective students of these universities because endowments can affect universities in a variety of ways that could potentially affect those prospective students. An example of this would be that universities with large endowments may be able to participate in more advanced research than those universities without as large of an endowment.
